BUSINESS REQUIREMENT DOCUMENT DRAFT · V0.7

Platform Automation & Reliability Agent

DRAFT An early outline written before platform access. It will be revised once the real platform has been reviewed.

DATE
2026-10-14

AUTHOR
Quincy Nkwain Ninying

MANAGER AND STAKEHOLDER
K.D. (AI Engineer)

APPROVALS
K.D. gives sign-off. A.M. oversees PR approvals, tool access and governance review.

Built from: Conversations with K.D., K.D.'s draft proposal, and the Project Factory briefing

CONTENTS

1. Purpose
2. The problem
3. What the agent would do
4. What stays with people
5. Guardrails
6. How we would know it works
7. First steps once access is granted
8. Questions for K.D.

1. Purpose

Give the platform team one reliable place to see what each agent does, how it is performing, and why something broke, so problems are understood faster and fixed with evidence.

2. The problem

- The platform runs many agents, and there is no single view of what each one does and whether it is healthy.
- Understanding how an existing app works, and why, takes longer than it should.
- Incident knowledge is not yet captured in a shared form, such as a decision log and runbooks.

3. What the agent would do

1. **Know what exists:** what each agent does, who owns it, when it runs, and what depends on it.
2. **Watch performance and headroom:** speed, failures, resource use and cost, with warnings before limits are reached.
3. **Investigate problems:** look at the evidence, work out the likely cause, and say how confident it is.
4. **Report clearly:** what went wrong, why, how to fix it and how to confirm the fix, with every claim linked to evidence.
5. **Answer questions:** for example, “What depends on this table?” or “Why did last night’s job fail?”
6. **Learn from confirmed outcomes:** reuse fixes a person has confirmed, and draft runbooks for repeat problems.

4. What stays with people

- Approving any change to a production system (K.D.), and approving pull requests and tools, plus governance review (A.M.)
- Confirming whether a diagnosis was right, and closing incidents
- Approving runbooks, thresholds and the agent’s own permissions

5. Guardrails

- Read-only to begin with. The agent reports and recommends; a person acts. Approved fixes may come much later.
- Only approved tools, its own service account, and a full record of what it did and why.
- It says “I don’t know” when the evidence is thin, and it never counts something as fine just because nobody checked it.

---

6. How we would know it works

- Time to understand an app or agent, before and after
- Time from a problem appearing to its likely cause, before and after
- Share of reports K.D. and the team mark as correct
- No changes made without approval

---

7. First steps once access is granted

1. Review what monitoring and data already exist, so nothing is built twice.
2. Agree the first scope with K.D.: the whole platform, or the backend services and agents first.
3. Write down the workflow as it really runs today, with K.D.
4. Mark every point where a person must decide.
5. For each capability, write what would prove it works.
6. Name the worst thing the agent could get wrong, and set its limits to match.

---

8. Questions for K.D.

1. Which problem would help you most if it were solved first?
2. Who should confirm whether a report was right?
3. Does a weekly 30-minute meeting on Thursdays work for you, starting Thursday 2026-10-22?

Draft for discussion with K.D. Nothing here is final until the platform has been reviewed.
